

Internship Task Report: Task 1 Day 1

Date: [1.06.2026]

Intern Name: [Mahek.oza]

(Interns Batch):- Cyber security

Target Website: <https://kryosync.netlify.app>

Task: Basic Security Review of KryoSync Website:-

For this task, I looked into the security of our website (<https://kryosync.netlify.app>) to see how safe it is from common web attacks and what small things we can improve.

1. What is already good (The Positives):

No Database = Less Risk: Since the site is hosted on Netlify as a static site (mostly HTML/CSS/JS), it doesn't use a live SQL database. This means hackers can't do things like "SQL Injection" to steal data or crash the site.

Component Analysis:-

I checked the frontend components of the website to see how they are organized and if there are any basic security or performance issues.

1. Navigation Bar

What it does: The top menu that lets users jump to different sections (Home, About, Services, Contact).

My Observation: It uses smooth scrolling links. From a security side, it's safe because it just redirects users within the page and doesn't load dangerous external links.

2. Services / Work Cards

What they do: Separate boxes or cards that show what KryoSync offers.

My Observation: These are mostly static layout components (using CSS Grid or Flexbox).

They are perfectly safe because they only display text and images, meaning there's no way for a user to input anything bad here.

3. Footer

What it does: The very bottom of the page with copyright info and social media icons (Instagram, LinkedIn, GitHub).

My Observation: For the social media icons, we need to make sure the links use `target="_blank"` (to open in a new tab) and include `rel="noopener noreferrer"`. This is a small coding trick that stops the opened page from slowing down or hijacking our website.

Reviewing the number of pages:-

I went through the website (<https://kryosync.netlify.app>)(<https://kryosync.netlify.app>) and clicked on every link to manually count the pages and check how the site navigation works.

Here is what I found and my analysis:

The Page Count: The website is actually built as a Single-Page Application Instead of having 5 or 6 separate page files that slow down the browser when you click them, everything is cleanly integrated into one main page that dynamically scrolls to different sections.

The 4 Main Sections I Tracked: Even though it acts as a single page, I mapped out the 4 main areas that users interact with:

1.Home Section: The top header with the main introduction text.

2.**Services Section:** The area listing tracks like Web Dev, Cyber Security, and Designing.

3.**Portfolio Section:** The gallery showing projects like Roamly and Agri Help.

4.**Contact / About Section:** The bottom part with company info and the input form.
